Structure 6:1035-1046(1998).

C. -!- FUNCTION: Has an integral role during the infection of macrophages in the mammallan host.

C. -!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and Pl' and basic residues at P2 and P3'. A model nonapeptide is cleaved at -Ala-Tyr-1-Leu-Lys-Lys.

C. -!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at P1 and P3'. A model nonapeptide is cleaved at -Ala-Tyr-1-Leu-Lys-Lys.

C. -!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at P1 and P3'. A model nonapeptide is cleaved at -Ala-Tyr-1-Leu-Lys-Lys.

C. -!- CATALYTIC ACTIVITY: A mached to the membrane by a GPT-anchor.

C. -!- PTM: THE PHOSPHATIDYILANSITOL MOIETY OF THE GPI-ANCHOR CONTAINS A FULLY SATURATED UNBRANCHED 2-0-ACYL CHAINS (C12:0, MIXTURE OF FULLY SATURATED UNBRANCHED 2-O-ACYL CHAINS (C12:0, C14:0, C16:0, AND C18:0).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MERÒPS; M08.001; -.

-:- SUBCELLULAR LOCATION: Outer membrane (By similarity).
-:- DOMAIN: CONTAINS MANY IMPERPEZT REPEATS OF THE CONSENSUS OCTAPEPTIDE A-G-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.
-:- SIMILARITY: Belongs to the bacterial ice nucleation protein

Mol. Gen. Genet. 223:163-166(1990).

-! FUNCTION: Ice mucleation proteins enable bacteria to nucleate crystallization in supercooled water.

-! SUBCELULIAR LOCATION: Outer membrane (By similarity).

-! DOMAIN: CONTAINS 153 IMPERFECT REPEATS OF THE CONSENSUS OCTAPEPTIDE A-G-Y-G-S-T-L-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUGGESTED IN WHICH THE ICH WINCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.

-! MISCELLANDOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICH WINCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.

-! SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                    Xanthomonas campestris (pv. translucens).
Bacteria; Proteobacteria; Gammaproteobacteria; Xanthomonadales;
Xanthomonadaceae; Xanthomonas.

                                                                                                                                                                                                                  -!- FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.
-!- SUBCELLULAR LOCATION: Outer membrane.
-!- DOMAIN: CONTAINS 126 INPRERFECT REPEATS OF A CONSENSUS OCTAPEPTIDE A-G-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PRENDUCITY IS SUPERIMPOSED.
-!- MISCELLANEOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

"Heterogeneity of the genes encoding the major surface glycoprotein
of Leishmania donovani.",
Mol. Biochem. Parasitol. 48:173-184(1991).
-!- FUNCTION: Has an integral role during the infection of macrophages
in the mammalian host.
-!- CATALYIC ACTIVITY: Preference for hydrophobic residues at Pl and
Pl' and basic residues at P2 and P3'. A model nonapeptide is
cleaved at -Ala-Tyr-|-Leu-Lys-Lys-.
-!- COFACTOR: Binds I zinc ion per subunit (By similarity).
-!- SUBCELDULAR LOCATION: Attached to the membrane by a GPI-anchor.
-!- SIMILARITY: Belongs to peptidase family M8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LEISHWANGLYSIN.

"Three distinct RNAs for the surface protease gp63 are differentially expressed during development of Leishannia donovani chagasi

"Three distinct RNAs for the surface protease gp63 are differentially promastigotes to an infectious form.",

"Deal Chem. 267-1888-1895(1992)."

"FUNCTION: Has an integral role during the infection of macrophages in the mammalian host.

"C-I- CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and Pl' and basic residues at P2 and P3'. A model nonapeptide is cleaved at Ala-Tyr-|-Leu-Lys-Lys-.

"C-I- COPACTOR: Binds 1 zinc ion per subunit (By similarity).

"SUNCELLULAR LOCATION: Actached to the membrane by a GPI-anchor.

"STMILARITY: Belongs to peptidase family M8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use, of thin aggregative fimbriae (SE17/TAF) nucleation depended assembly system of strains of Salmonella. Bscherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA. CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene back into the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromosome of the chromo

compy of that gene, and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foregan amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong communogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and the presentive to purify in large amount. The present sequence is given in

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEB17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and and Enterobacteriaceae for the production of fimbriae comprising recombinant of Enterobacteriaceae for the production of fimbriae comprising recombinant of AgfA, CsgA and AgfA-homologue fimbria subunits, respectively; (2) directing recombinant gene into the chromosome of the homologus species, replacing the native comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino protein containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino protein containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful consequencity and adhesion properties relevant for an efficient live vaccine, the carrier finbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response in an animal immune response in an animal important for an efficient live vaccine, the carrier finbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response in any properties relevant for an efficient live vaccine, the carrier finbrial subunit. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNAT------YDQLVTRVVT 112

assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and Enterpolateriaceae for the production of fimbriae comprising recombinant of gracting recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant ApfA protein which is useful for useful for the expension of recombinant ApfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response immunogens, which may be important for directing an immune response in an immune response in an expensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SDARKSETTITQSGYGNGADVGQGADNSŢIELTQNGFRNNAŢYDQLVTRVVTHEMAHAGG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant agfA gene having a segment replaced by a foreign DNA seguence which encodes foreign epitope or antigen, expresses recombinant AgfA
                                                                                                   The present sequence represents agfA encoded by the full agfA gene derived from Salmonella enteritidis 27655-3b. The nucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEPI)/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and aggregative fimbriah subunits, respectively; (2) assembly system of strains of Salmonella, Escherichia coli and containing the combination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene comprising species; (3) directing recombination of a recombinant gene comprising separating an aminologous species, replacing the native comprising separating an amino acid polymer comprising a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign amino protein containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments or diluent. (T) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to system the hererologous antigens are presented in high numbers (up to system the hererologous antigens are presented in high numbers (up to vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention researched in given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNAT-------YDQ 105

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (I) use of thin aggregative fimbriae (SET1/TAR) nucleation depended assembly system of strains of Salmonella Escherichia coli and AffA-homologue finbrin subunits, respectively; (2) alrecting recombination of a recombinant gene into the chromosome of the homologues species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune a replacement segment or segments of foreign amino acid polymer comprising separating an amino acid polymer comprising separating an animal and a salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a salmonella, E. coli or acid sequence or sequences grown on a salmonella, E. coli or acid sequence or sequences grown on a salmonella, E. coli or acid in minume response in an animal. In a finbrial presentation copyetem the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial presented in a minumal response in an animal protein are usually strong immunogens, which may be important for directing an immune response in an appearant secures as and secured sequence or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or experience or expe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                         Kay WW;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 137; 139pp; English.

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbrise (SERI)/TAF) nucleation depended assembly system of strains of salmonella, Escherichia coli and assembly system of strains of salmonella, Escherichia coli and assembly system of strains of salmonella, Escherichia coli and assembly system of strains of salmonella, Escherichia coli and assembly system of strains of a recombination of a recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal. Comprising a recombinant AgfA comprising separating an aminon acid polymer comprising a replacement sequence of sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences in an animal. In a fimbrial presentation cystem the heterologous antigens are presented in high numbers (up to system the heterologous antigens are presented in high numbers (up to system the heterologous antigens are presented in high numbers (up to vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response in manner easy and immune to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATYDQLVTRVVTHEMAHA-- 118

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEPI7/TAP) mucleation depended assembly system of strains of Salmonella. Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant CC directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an ending a replacement segment or segments of foreign amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Encertaceae host cell. from the host cell and introducing the polymer into the animal in conjunction with a carrier or dilutent. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful conjuncient, the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response conjunction, and hybrid fimbriae are easy and intexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                          Salmonella; agfA; chromosomal gene replacement; fimbrin; epitope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 151;

```
The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA cequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEPI)/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coll and AgfA-homologue fimbria of fimbriae comprising recombinant of a recombination of a recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant of a recombinant gene copy of that gene, and (4) eliciting an immume response in an animal, comprising separating an amino all additional and interoducing a recombinant AgfA protein containing a replacement segment or segments of foreign amino comprising separating an amino and salmonella, E. Coll or.

Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein mounders (up to coll of the expression of recombinant protein prosent of a suschil for caliciting an immume response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to coll occ an immume response in an animal. In a fimbrial presentation immune response in an animal are usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong capainst the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SERT/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue finbrin submits, respectively; (2) directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to $500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MKLLKVAAFAAI VVSGSALAGVVPQWGGGGNHNGGGNSSGPDYDQLVTRVVTHEMAHALQ

assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant of Enterobacteriaceae for the production of fimbriae comprising recombinant of directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence in mimule nesponse in an aminal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response immunogens, which may be important for directing an immune response immunogens the exemplification of the present invention

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA segment with the encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbries (BER17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and affA. CsgA and AgfA. homologue fimbrin subunits, respectively. (2) directing recombination of fimbries comprising recombinant of homologous species; (3) directing recombination of a recombinant of the chromosome of the homologous species; (3) directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising speraring an amino acid polywer comprising a replacement segment comprising a recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to sout mannogenicity and adhesion properties relevant for a efficient live in mannogenicity and adhesion properties relevant for a mefficient live in mannogenicity and adhesion properties relevant for an efficient live
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATYDQLVTRVVTHEMAHAGG 120

The invention relates to an isolated peptide capable of binding a mammalian plasma protein or of generating an immune response in a mammal selected from sequences shown in ABR82642, ABR82648-49. The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SDARKSETTITOSGYGNGADVGOGADNSTIELTONGFRNNATYDOLVTRVVTHEMAHAGG 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MKLLKVAAFAAI VVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSI YQYGSANAALALQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA comparison encoded a foreign epicope or antigen. Also described are: (1) use of thin aggregative finbriae (SFBI)/TAP) mucleation depended assembly system of strains of Salmonella, Escherichia coli and contained strains of Salmonella, Escherichia coli and contained and AgfA-homologue fimbriae (SFBI)/TAP) mucleation depended assembly system of strains of a recombination of inprising recombinant containing recombination of a recombination of a recombination of a recombinant gene into the chromosome of the homologue species, replacing the native comprising separating an amino acid polymer comprising a recombinant gene comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a namino acid polymer comprising recombinant AgfA protein containing a namino acid polymer of acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriacee host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful containing an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein sare usually strong immunogens, which may be important for directing an immune response contains and properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong against the inserted epitope, and hybrid fimbriae are usually strong immunogens, which may be important for directing an immune response in example in a properties are usually sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATYDQLVTRVVTHEMAHAGG 120

Sequence 59, Application US/08233788A

Patent No.; 5635617

GENERAL INFORMATION

APPLICANT: Doran, James L.

APPLICANT: Kay, William W.

APPLICANT: Collinson, Karen S.

APPLICANT: Clouther, Sharen C.

TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR DETECTION

TITLE OF INVENTION: OF SALMONELLA

NUMBER OF SEQUENCES: 61

CORRESPONDENCE ADDRESS:

ADDRESSEE: Seed and Berry

STREET: 6300 Columbia Center, 701 Fifth Anners

CITY: Seattle
                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   88.0%; Score 676; DB 1; Length 151; 90.1%; Pred.
